

Pump up the Savings

Make the switch to a Heat Pump Water Heater!

Heat pump water heaters work much more efficiently than their standard electric counterparts, and that means you can save up to 60% on your monthly electric water heating costs for years to come. *(Rebates available only while funding lasts)*

How it works:

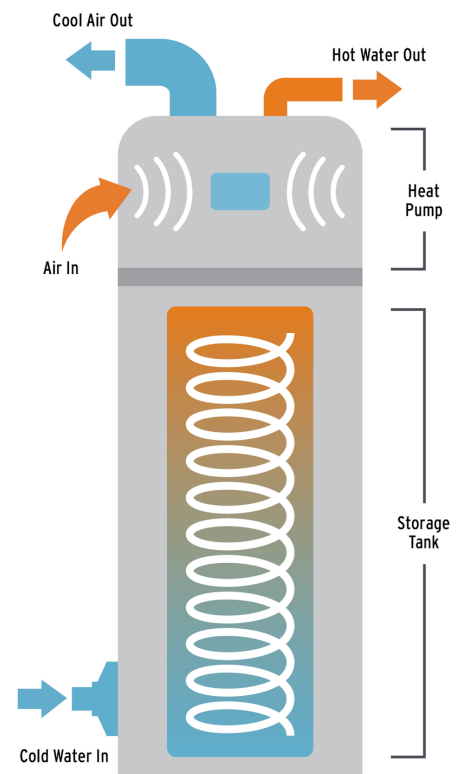

A standard electric water heater uses more energy than a refrigerator, dishwasher, clothes washer and dryer combined. An electric hybrid water heater uses electricity differently — moving heat rather than generating it, so you use 2-to-3 times less energy, and save more money.

Save money:

Compared to a standard electric water heater, an electric hybrid water heater uses 60% less energy. That can save you up to 10% on your energy bill — about \$3,500 over the life of the water heater. And with a utility rebate, you can save even more.

Be more efficient:

Electric hybrid water heaters are designed to be energy efficient and good for the planet. By cutting electricity use by up to 60%, they have a direct effect on reducing greenhouse gas emissions.
